

## Tooth Ache, Infection and Clove Oil

July 26, 2005

My office assistant's husband, Jeff, had a toothache, which became severe enough that before he could get into a dentist's office, his whole jaw had swollen. I gave Cindy some clove oil for him to see what would happen.

This morning, he said that he had tried aspirin. He had tried Ambosol. He had tried some "left over" prescription pain pills. Nothing had alleviated the pain. Within a minute of applying the clove oil, Jeff said it began working and it "worked like a miracle."

Jeff knew that when a dentist finally could see him, that he would probably still be told that the tooth could not be worked on or extracted because of the infection which caused the swelling. Clove oil, however, has antimicrobial, antiseptic, antibacterial and other properties which will wipe out the infection.
